Homework 1 Queries

- What is the GPA of the student with ID=1?
- What courses were taught in both Spring of 2014 and Fall of 2014?
- How many open seats are there in section 010 of CISC437 in Spring 2015?
- What are the average GPAs for students by department?

Database Design Process

- Start with enterprise requirements
 - → Translate to a conceptual model
 - → Translate to a logical model
 - → Translate to a physical model
- Iterate each step to ensure that every requirement that needs to be captured and that can be captured actually is captured

3

Database Design Process

- Start with enterprise requirements
 - → Translate to a conceptual model
 - Entity-Relationship model (E-R model)
 - →Translate to a logical model
 - Relational model
 - →Translate to a physical model
 - Implement in a database

Qualities of Good RDB Design

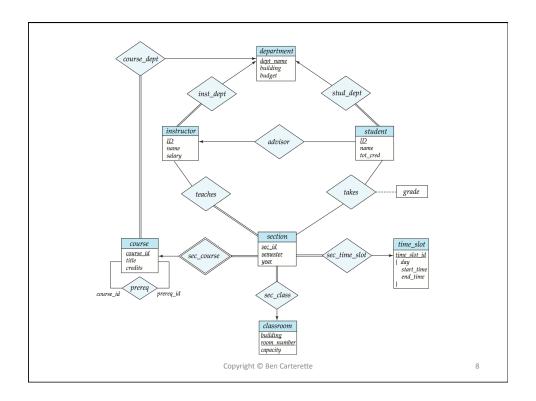

- Correctly captures requirements of enterprise
- Maintains data integrity and accuracy
 - Referential integrity
- Minimal redundancy
 - Doesn't store the same data in more than one place
 - Except for foreign keys
- · Efficient querying, data updates
- Fundamental design trade-off:
 - Fewer large tables versus more small tables

University Requirements

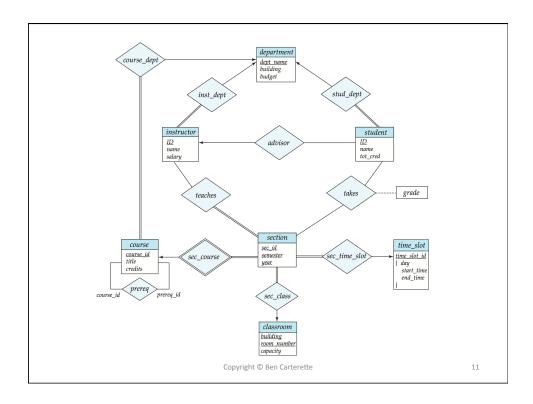

- Requirements regarding people in the university:
 - instructors are identified by an ID num, and we need to store their name and salary
 - every instructor must also be associated with exactly one department
 - students are identified by an ID num, and we need to store their name and total credits
 - every student must also be associated with exactly one department
 - a student can have at most one instructor as advisor
 instructors can advise any number of students
- Requirements regarding courses and course scheduling:
 - courses have IDs, titles, and number of credits
 - every course must be associated with exactly one department
 - courses are scheduled into sections
 - a section of a course is identified by a section number, semester, and year
 - a section must be associated with exactly one course, though a course can have multiple sections
 - each section takes place in exactly one classroom (which has a certain capacity), and at exactly one of a pre-determined set of time slots
 - students take a section of a course for a grade
 - each section is taught by one or more instructors
 - some courses have one or more prerequisite courses
- Requirements regarding departments:
 - departments are identified by a name, and we need to store their home building and budget

Translating an E-R Diagram to Relational Schema

- Basic steps:
 - 1. Define a relation for each entity set
 - Primary key of relation = unique identifier of entity
 - 2. Define a relation for each relationship set
 - Primary key of relation = concatenation of unique identifiers of entity sets involved
 - Define foreign key to relations representing entity sets
 - 3. Modify keys of relations defined in step 2 to capture mapping constraints as necessary
 - 4. Eliminate redundant relations
 - Relations that have exactly the same fields and keys
 - 5. Merge relations with the same keys to capture participation constraints as necessary
 - 6. Check normal forms and normalize relations as needed

LO

1. Define Relations for Each Entity Set

student(<u>ID</u>, name, tot_cred)
instructor(<u>ID</u>, name, salary)
course(<u>course_id</u>, title, credits)
department(<u>dept_name</u>, building, budget)
classroom(<u>building</u>, <u>room_no</u>, capacity)

time_slot(<u>time_slot_id</u>, <u>day</u>, <u>start_time</u>, end_time)
section(<u>course_id</u>, <u>sec_id</u>, <u>semester</u>, <u>year</u>)

Copyright © Ben Carterette

2. Define Relations for Each Relationship Set

stud_dept(<u>ID</u>, <u>dept_name</u>)
inst_dept(<u>ID</u>, <u>dept_name</u>)
course_dept(<u>course_id</u>, <u>dept_name</u>)
advisor(<u>s_ID</u>, <u>i_ID</u>)

sec_course(<u>course_id</u>, <u>sec_id</u>, <u>semester</u>, <u>year</u>)
sec_time_slot(<u>course_id</u>, <u>sec_id</u>, <u>semester</u>, <u>year</u>, <u>time_slot_id</u>)
sec_class(<u>course_id</u>, <u>sec_id</u>, <u>semester</u>, <u>year</u>, <u>building</u>, <u>room_no</u>)

takes(<u>ID</u>, <u>course_id</u>, <u>sec_id</u>, <u>semester</u>, <u>year</u>, grade) teaches(<u>ID</u>, <u>course_id</u>, <u>sec_id</u>, <u>semester</u>, <u>year</u>)

prereq(course id, prereq id)

Copyright © Ben Carterette

13

3. Modify Keys to Capture Mapping Constraints

- Simple rules:
 - Many-to-many relationships: no change to keys
 - takes(<u>ID</u>, <u>course id</u>, <u>sec id</u>, <u>semester</u>, <u>year</u>, grade)
 - teaches(<u>ID</u>, <u>course_id</u>, <u>sec_id</u>, <u>semester</u>, <u>year</u>)
 - prereq(course id, prereq id)
 - Many-to-one relationships: primary key is the key of the entity set on the "many" side
 - stud_dept(<u>ID</u>, dept_name)
 - inst_dept(<u>ID</u>, dept_name)
 - course_dept(course_id, dept_name)
 - advisor(<u>s_ID</u>, i_ID)
 - sec_time_slot(course_id, sec_id, semester, year, time_slot_id)
 - sec_class(<u>course_id</u>, <u>sec_id</u>, <u>semester</u>, <u>year</u>, building, room_no)
 - One-to-one relationships: pick one of the entity sets to give the primary key; define the other fields UNIQUE

Copyright © Ben Carterette

4. Eliminate Redundant Relations

- At this point we have two different relations representing sections
 - section(course id, sec id, semester, year)
 - sec_course(<u>course_id</u>, <u>sec_id</u>, <u>semester</u>, <u>year</u>)
- These are identical—we only need one
 - Keep section(course id, sec id, semester, year)

Copyright © Ben Carterette

15

5. Merge Relations to Capture Participation Constraints

- First look for relations with the same primary key
 - student(ID, name, tot cred) & advisor(s ID, i ID)
 - student(<u>ID</u>, name, tot_cred) & stud_dept(<u>ID</u>, dept_name)
 - takes(<u>ID</u>, <u>course id</u>, <u>sec id</u>, <u>semester</u>, <u>year</u>, grade) & teaches(<u>ID</u>, <u>course id</u>, <u>sec id</u>, <u>semester</u>, <u>year</u>)
 - section(<u>course id</u>, <u>sec id</u>, <u>semester</u>, <u>year</u>) &
 sec_time_slot(<u>course id</u>, <u>sec id</u>, <u>semester</u>, <u>year</u>,
 time_slot_id) & sec_class(<u>course id</u>, <u>sec id</u>, <u>semester</u>,
 year, building, room no)

Copyright © Ben Carterette

5. Merge Relations to Capture Participation Constraints

- Then look at participation constraints on E-R diagram:
 - No relationship: do nothing
 - No relationship between takes(<u>ID</u>, <u>course_id</u>, <u>sec_id</u>, <u>semester</u>, <u>year</u>, grade) & teaches(<u>ID</u>, <u>course_id</u>, <u>sec_id</u>, <u>semester</u>, <u>year</u>)
 - Partial participation: no change
 - student(<u>ID</u>, name, tot_cred) & advisor(<u>s_ID</u>, i_ID)
 - Total participation: merge relations and define foreign key NOT NULL
 - student(<u>ID</u>, name, tot_cred); stud_dept(<u>ID</u>, dept_name)
 - → student(<u>ID</u>, name, tot_cred, dept_name)
 - instructor(<u>ID</u>, name, salary); inst_dept(<u>ID</u>, dept_name)
 - → instructor(<u>ID</u>, name, salary, dept_name)
 - course(course_id, title, credits); course_dept(ID, dept_name)
 - → course(<u>course_id</u>, title, credits, dept_name)
 - section(<u>course_id</u>, <u>sec_id</u>, <u>semester</u>, <u>year</u>); sec_time_slot(<u>course_id</u>, <u>sec_id</u>, <u>semester</u>, <u>year</u>, time_slot_id); sec_class(<u>course_id</u>, <u>sec_id</u>, <u>semester</u>, <u>year</u>, building, room_no)
 - → section(course_id, sec_id, semester, year, building, room_no, time_slot_id)

17

6. Check Normal Forms

• Topic of next week's lectures

Copyright © Ben Carterette

Other Things

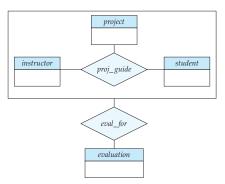

- Hierarchies/inheritance
 - Define a relation for each entity set in the hierarchy
 - Each relation has primary key = unique identifier of toplevel entity set
 - Each relation's primary key is also a foreign key to the relation representing the entity set it inherits from
 - When inheritance is disjoint, you can merge relations for parent and child entity sets

Copyright © Ben Carterette

Other Things

Aggregation

 Relation representing eval_for relationship set needs to have as primary key the concatenation of primary keys on all four entity sets involved
